Table of Contents

Preface

Part 1 – Design Architectures for Red Hat OpenShift

1

Hybrid Cloud Journey and Strategies

Main challenges of the public cloud

Benefits of the public cloud

Is hybrid cloud the solution?

Containers and Kubernetes – part of the answer!

OpenShift – a complete option

OpenShift offerings – multiple options to meet any needs

OpenShift installation modes

OpenShift multi-cluster tools – going above and beyond

Summary

Further reading

2

Architecture Overview and Definitions

Technical requirements

Prerequisites

Understanding the foundational concepts

Master nodes

Bootstrap node

Workers

Highly available cluster

OpenShift architectural concepts and best practices

Installation mode

Computing

Aggregated logging

Monitoring

Storage

Example

Infrastructure/cloud provider

Network considerations

VPC/VNet

DNS

Load balancers

DHCP/IPMI/PXE

Internet access

Other considerations

SSL certificates

IdPs

OpenShift architectural checklists

Summary

Further reading

3

Multi-Tenant Considerations

What is multitenancy?

Handling multiple tenants

Multitenancy in OpenShift

Multi-tenant strategies

OpenShift multitenancy checklist

Summary

Further reading

4

OpenShift Personas and Skillsets

Personas

A system/cloud/platform administrator

IT architect

Application developer

The DevOps engineer/SRE

The security engineers

The skills matrix

Architecture-, infrastructure-, and automation-related skills

Development-, container-, and CI/CD-related skills

OpenShift-related skills

Summary

Further reading

Part 2 – Leverage Enterprise Products with Red Hat OpenShift

5

OpenShift Deployment

Requirements

OpenShift checklist opt-in

Lab requisites

OpenShift installation prerequisites

UPI/agnostic installer

IPI

Preparing for the installation

An SSH key pair

Pull secret

OpenShift installer binary

OpenShift command-line tools

Installation configuration file (install-config.yaml)

Installation

Phase 1 – Provisioning servers

Phase 2 – Bootstrap and control plane

Phase 3 – Check for certificates to sign – For UPI and agnostic installations only

Phase 4 – Finishing the installation

What's next?

FAQs

Summary

Further reading

6

OpenShift Troubleshooting, Performance, and Best Practices

Things that can crash a cluster

Operators

etcd

Authentication

Troubleshooting reference guide – how to start

Describing objects

Events

Pod logs

Deployment logs

Debugging pods

Operator logs

Other oc CLI commands and options

Understanding misleading error messages

ImagePullBackOff

CrashLoopBackOff

Init:0/1

Summary

Further reading

7

OpenShift Network

OpenShift networking

How does traffic work on Open vSwitch?

Network type – OpenShift SDN or OVN-Kubernetes

Network policies

North-south traffic

East-west traffic

Controlling network traffic

Creating a network policy

What is an ingress controller?

How does an ingress operator work?

Creating a new ingress controller

Testing the new ingress

Types of routes

Passthrough routes

Edge routes

Reencrypted routes

Summary

Further reading

8

OpenShift Security

Container security

Control

Protect

Detect and respond

AuthN and AuthZ

Authentication

IdPs

Authorization – RBAC

Access-control troubleshooting

Certificates in OpenShift

Trusted CA

etcd encryption

Container isolation

SCCs

Network isolation

Red Hat Container Catalog

Red Hat UBI

Limiting image registry sources

Summary

Further reading

Part 3 – Multi-Cluster CI/CD on OpenShift Using GitOps

9

OpenShift Pipelines – Tekton

Technical requirements

Installing and using CRC

What is OpenShift Pipelines?

What is Tekton?

Main benefits

Tekton components

Concepts

Installing OpenShift Pipelines

Prerequisites

Installation

Installing the tkn CLI

Creating a Tekton pipeline from scratch

Tasks

TaskRun

Pipelines

PipelineRun

Using triggers with GitHub webhooks

TriggerBinding

TriggerTemplate

Trigger

EventListener

Creating a GitHub webhook

Testing the Tekton trigger

Fixing the failed PipelineRun due to YAML issues

Summary

Further reading

10

OpenShift GitOps – Argo CD

What is GitOps?

What is Argo CD?

Application delivery model

Installing OpenShift GitOps

Prerequisites

Installation

Installing the argocd CLI

Configuring Argo CD against multiple clusters

Argo CD definitions and challenges

GitHub repository structure

Templating Kubernetes manifests

Managing secrets

Argo CD main objects

AppProject

Applications

Deploying an application using GitOps

Building a new image version

Deploying in development

Promoting to QA

Promoting to production

Deploying to multiple clusters

Summary

Further reading

11

OpenShift Multi-Cluster GitOps and Management

What is Red Hat ACM?

Red Hat ACM installation

Prerequisites

Installation

Managing clusters using Red Hat ACM

Cluster provisioning

Managing applications using Red Hat ACM

Application Subscription model

OpenShift GitOps (Argo CD) and ApplicationSets

Governance using Red Hat ACM

Multi-cluster observability with Red Hat ACM

Prerequisites

Enabling the observability service

Summary

Further reading

Part 4 – A Taste of Multi-Cluster Implementation and Security Compliance

12

OpenShift Multi-Cluster Security313

What is Red Hat Advanced Cluster Security?

Red Hat Advanced Cluster Security installation

Prerequisites

Operator installation

ACS Central installation

Adding secured clusters

Policies and violations

Security policies

Violations

Vulnerability management

Risk profiling

Compliance

Configuration Management

Network segmentation

Network flows

Network Policy Simulator

Summary

Further reading

13

OpenShift Plus – a Multi-Cluster Enterprise Ready Solution

Introducing Red Hat Quay

Deploying Red Hat Quay using the Quay Operator

Prerequisites

Operator installation

Configuring Quay

Using Red Hat Quay

Running the tutorial

What is OpenShift Plus?

Value proposition: benefits

OpenShift Plus – a practical use case

Summary

Further reading

14

Building a Cloud-Native Use Case on a Hybrid Cloud Environment

Use case description

Application build using OpenShift Pipelines and S2I

Configuring the image registry

Linking image registry credentials

Checking the image on Quay

Application deployment using OpenShift Pipelines and GitOps

Adding security checks in the building and deployment process

Fixing security issues

Provisioning and managing multiple clusters

Provisioning new clusters

Cluster governance

Deploying an application into multiple clusters

Summary

Further reading

Part 5 – Continuous Learning

15

What's Next

Red Hat training

Training and certifications

Online learning platforms

Free training and references

OpenShift Container Platform Demo and Workshop Guide

OpenShift 4 101 Workshop

Open Demos

Red Hat Developer portal

YouTube and Twitch

Blogs

Product documentation

Summary
